

## -Laboratoriya ishi. Simsiz tarmoqlar bilan ishlash

**Ishning maqsadi:** Talabalarda Simsiz tarmoqlar bilan ishlash bo'yicha ko'nikma va malakasini oshirish.

### Bajariladigan ishlar ketma-ketligi:

Ulashimiz kerak bo'lgan kompyuterlarni barchasini biror nom bilan nomlab, ularni bir guruhga birlashtiramiz. Avval esa kompyuter nomini, "Bosh kompyuter" qilib o'zgartiramiz, ya'ni quyidagicha:

1. Этот компьютер (o'ng tugma) → свойства

2.  bandini quyidagi ketma-ketlikda o'zgartiramiz.

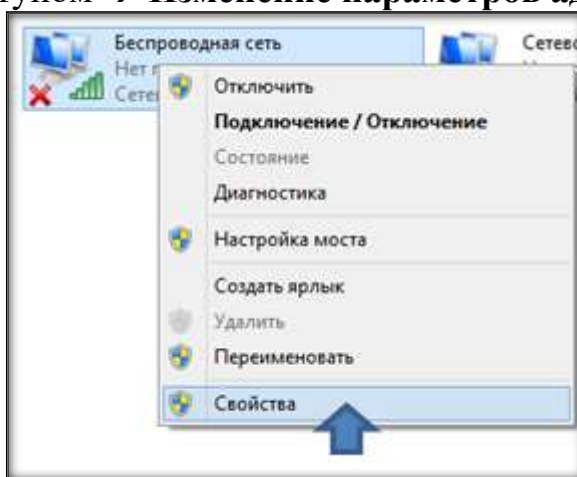

Bajargan amallarimiz natijasi quyidagicha:

Endi bizning kompyuterimizning ishchi guruhi nomi „OFFICE” ga o‘zgardi. Keyingi ishimiz WiFi uchun IP – manzil kiritamiz, ya’ni **Беспроводная сеть** uchun alohida manzil kiritamiz. Buning uchun quyidagi ketma – ketlikni bajaramiz:

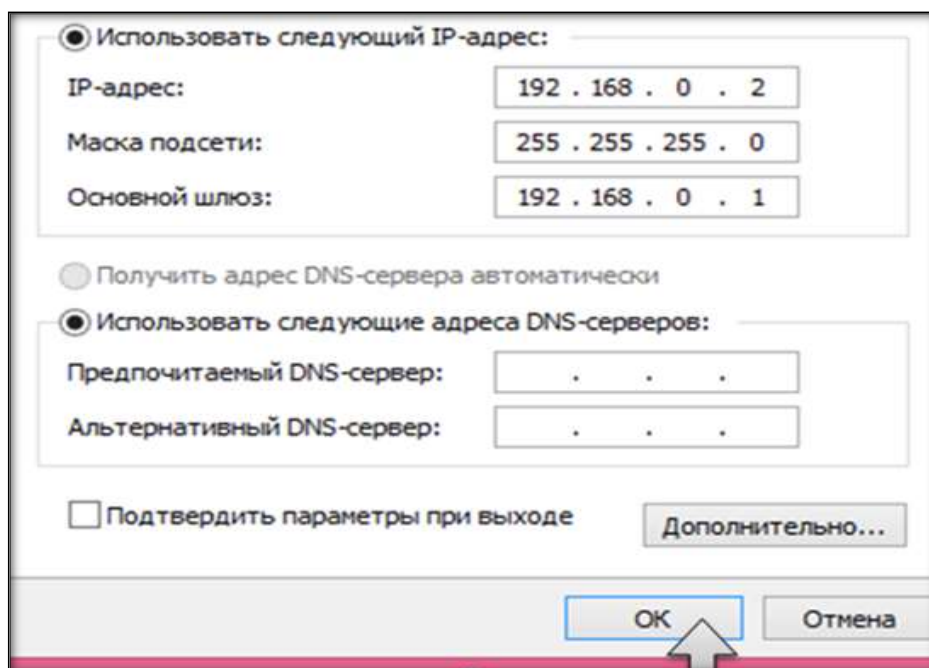

3. Панель управление → Сеть и интернет → Центр управления сетями и общим доступом → **Изменение параметров адаптера**

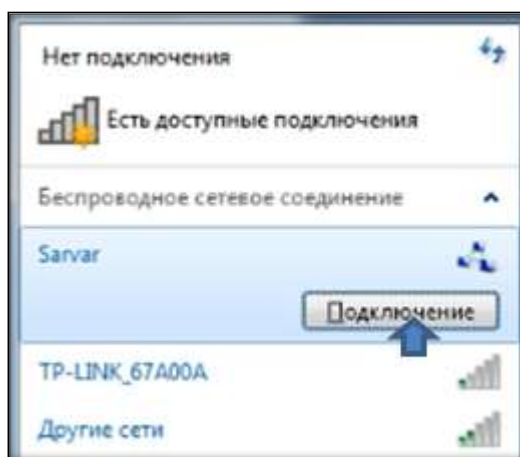

4. Hosil bo‘lgan oynadan quyidagilarni tanlaymiz.

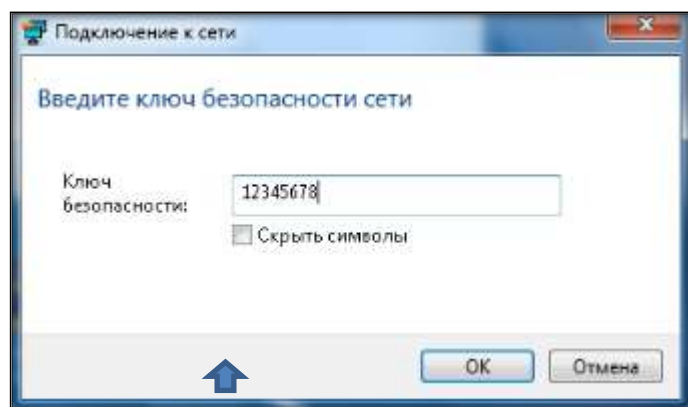

5. IP – manzilni quyidagicha ko‘rinishda kiritamiz:

6. Aloqa o'rnatishni boshlaymiz:

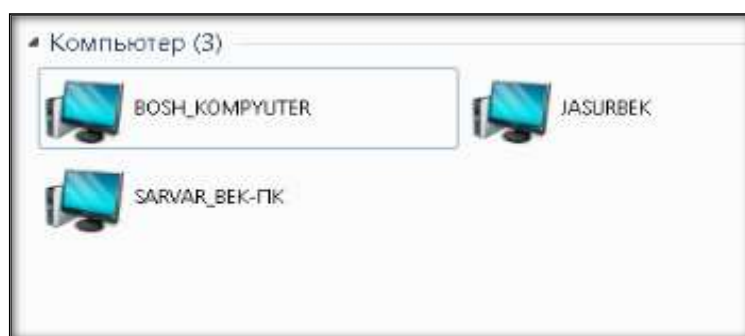

Har bir foydalanuvchi o'zining kalitiga ya'ni kodiga ega bo'ladi. Bu kod kamida 8 ta raqamdan iborat bo'lishi kerak. Shuni ham ta'kidlash kerakki, kompyuter egasi kodni aytmasa biz uni bilolmaymiz va aloqa qilolmaymiz!

Endigina vazifamiz ma'lumot almashishni boshlaymiz. Buning uchun quyidagilarni bajaramiz . . .

Demak, tarmog'imiz quyidagi kompyuterlardan tashkil topgan.

“Tarmoq yaratdik” degani, ma'lumot almashish mumkin degani emas. Biz faqat **Доступ** berilgan kataloglargagina ko'ra olamiz. **Доступ** berish quyidagicha:

( istalgan papka yoki disk ) → свойства → доступ

8.

yoki

9.

Bir paytda foydalanuvchilar soni

10.

Foydalanish turini belgilovchi oyna.

1. Umumiy ruxsat.

2. O'zgartirishga ruxsat ( o'chirish, saqlash mumkin ).

3. Ko'rishga ruxsat ( ko'rish, nusxa olish mumkin, o'zgartirib bo'lmaydi ).

**Доступ берилган** hujjat yoki diskni, **доступ берilmaganidan** farqi:

Kataloglarda quyidagicha ko'rinish:

доступ берилган holat.

доступ берilmagan holat.

Yuqoridagi bilimlarni o'zlashtirish orqali siz, WiFi orqali Lokal tamoq hosil qilishni o'rganasiz.

### Topshiriqlar:

1. Windows7 tizimida simsiz tarmoq hosil qiling.
2. Windows8 tizimida simsiz tarmoq hosil qiling.
3. Windows10 tizimida simsiz tarmoq hosil qiling.
